***Abstract*—This manuscript demonstrates a collaborative workflow for writing IEEE journal papers with local LaTeX, Git, and visual revision tracking. Replace this abstract with a concise summary of your contributions, methods, and main results.**

***Index Terms*—Collaborative writing, Git, IEEE, LaTeX, version control**

I. Introduction

IN the coming years, research teams will increasingly rely on version control to manage manuscript revisions. This template is a minimal IEEE journal starting point that compiles with `latexmk` and works well with VS Code and LaTeX Workshop.

Sample citations appear as [1]–[3].

II. Proposed Approach

The proposed approach combines local compilation, Git commits for every meaningful edit, and `git-latexdiff` (or the LaTeX Diff editor extension) to produce colored PDFs between any two revisions.

Fig. 1 shows a sample plot stored under `figures/`. Replace it with your own graphics and keep stable filenames across revisions.

III. Results

A first pass over the sample data shows a clear upward trend in Fig. 1. Report effect sizes and confidence intervals here when you replace this placeholder.

IV. Conclusion

~~Summarize the main findings and outline~~ The sample workflow is enough for a small co-author team to compile locally, share commits on GitHub, and produce a colored revision PDF. Replace this paragraph with your own findings and future work.

Acknowledgment

The authors would like to thank colleagues who tested this collaborative LaTeX workflow.
